

Could you imagine a world without communication and lack information? How would it be? Perhaps that is why social media communication has taken an exponential growth in the last decade. Our goal is to create a convenient educational media for sharing relevant information between peers.

## **BINET (Broad Information NETwork)**

BINET is an app that connects a Highschool or university's communities such as students, professors, advisors with other communities of a different university. It can be thought of as the Facebook of universities.

The goal of this app is to easily provide information to students and faculty across a school or different school. This would be done by, but not limited to the following:

- Allow the provision of information such as Volunteering opportunities, internships and jobs by Institutions, companies and organizations.

- Allow the connection of students and faculty all over the participating institutions for purposes such as mentorship, tutoring, inquiries etc.

- Allow students to build a profile with verified credentials that can be used to apply for jobs, internships etc. This also helps in targeting relevant internships/jobs opportunities to each student.

- Permit connection of students during admission application, and after acceptance into a school and helps with roommate pairing

- Matches your qualifications with universities or graduate schools if you are in high school or undergrad and indicated interest in furthering education.

Currently, some of these processes could be achieved by using Handshake, Emails and other existing software such as Zeemee, but BINET is/will be special in its own type and functional usage.
